

EndWarts

Wart Removing Treatments

New effective treatment for self removal of warts

Formic Acid:

EndWarts contains Formic Acid.¹

There is a new treatment which, according to three different published clinical studies, e.g. International Journal of Dermatology 2001, results in the disappearance of more than 90% of warts. Formic Acid is being used in this treatment method and has proved to be very effective, painless and also suitable for children. An average of 4 to 5 treatments were required, but after 12 treatments more than 90% were free of warts.²
